Dear Recruiter,

From a young age, I have been fascinated with the intricacies of new technologies; the more I tinkered and messed around with different things in this area, the more I fueled my passion for creating and building digital structures and products.

This deep immersion in this area, added with my innate curiosity and self-teaching skills, has led me to thirst for learning about the ins-and-outs of web applications, for researching ways of improving them, and keeping up with the light-speed pace that this are develops.

Through my college career, I have acquired circa a year and a half of experience developing in C++, Java, and JavaScript, dabbling in SQL and NoSQL databases, and having to learn new languages overnight for a niche project I got myself on.

In my half-year doing work for the Data Visualization team at Worcester Polytechnic Institute I have led the development of a grassroots full-stack codebase using a variety of JavaScript frameworks, working with different teams in a research environment, in order to use machine learning and facial and mood recognition to improve teacher feedback in school environments.

During my internship at Bose Corp. I worked in a small team, in cooperation with different departments, to build a web application that tied multiple new and existing services in the Bose infrastructure and deliver a brand new, safe and efficient user and developer experience.

As a focused and driven software engineer, I take user experience and performance seriously, and care for code cleanliness, efficiency, and readability. I believe my excitement, passion, and collaborative nature would make a positive impact in the company's engineering team and help further ship incredible applications.

Thank you immensely for your time and consideration.
